

In principle, the coating of **Satina Temperable Mirror** can be thermally toughened even on the pulley roll side. Chromium mirror glass can therefore be converted to toughened glass, giving it a huge advantage over conventional silvered mirrors! Wet treatment and surface processing (grinding, drilling, engraving or screen printing) are possible. The coatings on the Face 2 are applied using a magnetron process.

**YORGLASS**  
SATINATED

## Satina Temperable Mirror

**Acid etched mirrors** will bring both a classic and an eye-catching perspective to your living space.

Due to special washing and production process like all the other **Yorglas®** products they have **non-fingerprint** and **scratch resistant** feature, no empty margins on the sheet and each sheet is controlled visually and technically before shipment.
